

# The economic cost of long term care in Turkey

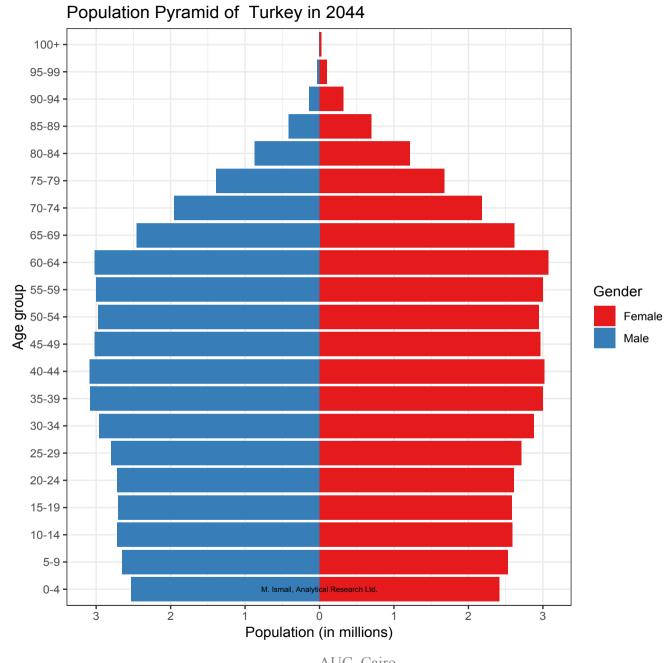

Mohamed Ismail Analytical Research Ltd, UK

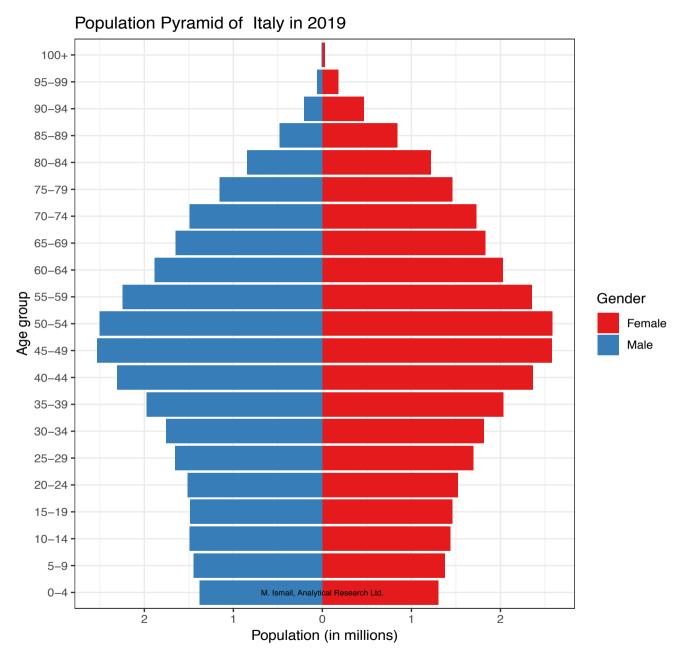

### Introduction

- This presentation aims to:
  - Give an overview of the state of long term care in Turkey.
  - Highlights the likely future economic cost.
- It builds on field work and visits.
- It uses data from (WHO, WB, OECD and US Census Beureau).
- All graphs, maps, calculations are authors' own.

### State of LTC system in Turkey

- Two main (parallel) systems of long-term care
  - informal care providers, such as unpaid family members
  - formal care providers,
    - Range of state, private & NGOs provision with various extent and quality
    - Social assistance programme- mixture of service and cash benefits
    - Improved generalised provision of palliative care (from capacity building in 2006; WHO 2104))
- Family-based with majority of LTC provided by women
  - High financial, emotional and physical burden on the family
  - Implications on women's labour participation, physical health and emotional wellbeing (26% female labour participation vs. 71% for men)

### Where do we stand?

- A focus on institutional care with lack of homebased LTC provision
- Variability in provision across municipalities
- Strong norms & cultural beliefs of duty of care to the elderly
- Gender imbalance of expectations of LTC with high informal care reliance
- Emerging mixed-market: regulations and standards are in need of updating

#### Moving Forward

- Build on what is available and address gaps and shortfalls
- Prepare for projected increased demands
- Adapt from the European experiences to the specific Turkish context
- Move towards 'system approach' rather than isolated interventions

- Italy:
  - LTC expenditures accounts for 1.12% of GDP
  - 80% of budget devoted to care in the community (cash and service in kind)
  - Only 3% of older people use care homes
  - Funded through general taxation system
  - Funding, governance and management responsibilities spread over municipalities
  - Family plays an important role supported by various cash allowances 'cash-for-care' (family based model)
  - Significant regional variations

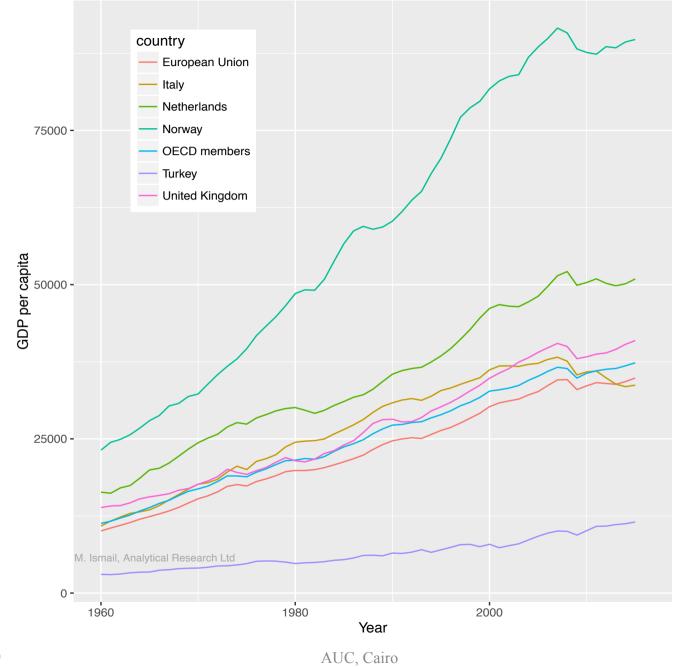

- The Netherlands:
  - Highest public expenditures on LTC in OECD countries at 3.7% of GDP
  - The philosophy that the state bears the responsibility of LTC not the individual or the family
  - Funded by national insurance scheme covering all citizens- covering both home and residential care; with some contribution based on income (Corporatist model)
  - Introduced some forms of cash-for-care but this was stopped in 2010

- Norway:
  - LTC expenditures accounts for 2.2% of GDP + 2% of GDP spent for health related LTC
  - Universal coverage with little contribution from individuals (Universal model)
  - Moved steadily from institutional to home care
  - All LTC services traditionally provided in kind with recent introduction of cash for care option (only 2 to 3%)
  - No assumptions about family responsibility
  - Funded through national & local taxations
  - Care organisations affiliated with municipalities
  - Strong policies of extending working lives

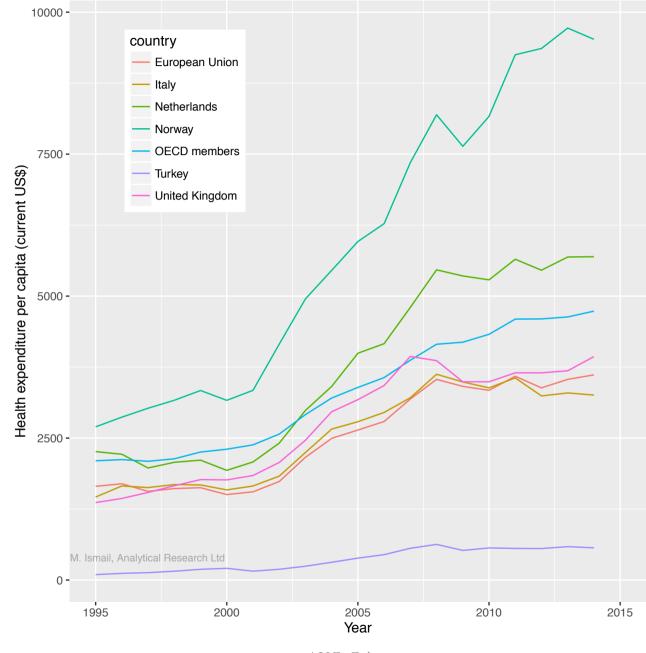

- The United Kingdom:
  - Public spending on LTC has fallen significantly over the past 10 years – currently around 1% of GDP
    - declining from a budget of around £8.3 billion in 2005 to £6.3 billion in real terms in 2015 – budget projections show further reductions over the coming year
  - The Care Act 2014 made Personal Budgets to be offered to 100% of eligible users
  - Financed by central and local government, the National Health Service (some nursing homes), charities and individuals
  - The model is based on mixed-market economy and is means-tested to protect the most vulnerable (residual model)

### Market Shaping

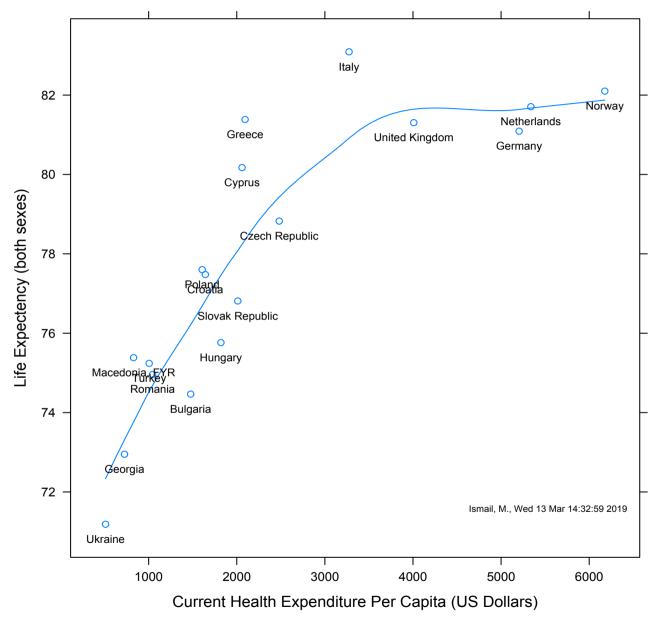

- Setting necessary standards and regulations for a responsive, diverse and sustainable LTC market
- Commissioning and approval processes
- Recognise, and integrate LTC services with other services
- Incentives for businesses to provide varied, high quality and affordable services
- Estimate the cost and plan for funding

A would be an alternative approach. See Ismail M., 2014

## Conclusion

- Different demographic transition stages and health expenditure
- Various ideologies of care and responsibilities
- All moving steadily towards 'ageing in place' with a focus on home and community care
- Funding, regulations and workforce issues are key challenges and receive considerable debate
- Thinking about the Turkish context and formulating a context-specific LTC model
- Personal budgets are likely to emerge as one of the favorite options.
